

*PAN-EUROPEAN INFRASTRUCTURE
FOR OCEAN & MARINE DATA
MANAGEMENT*

SeaDataNet

***Download manager,
development status***

Aurelie Briand, Thomas Loubrieu (IFREMER), Sophie Brégent (ALTRAN),
Serge van der Horst, Flavian Gheorghe(MARIS)

Releases since previous plenary meeting

- 1.4.0 (for geoseas) , Decembre 2012
- 1.4.1 (splitter bug correction), February 2013
- 1.4.2 Septembre 2013:
 - NVS v2 management for modus2 (generated files).
 - New checker functions

Checker requirements

- Check that local CDI are actually reachable, depending on modus:
 - 1: local file exists and is readable
 - 2: SQL request can be performed
 - 3: local ODV file exists and is readable

New checker requirements

- Check that local coupling table and central CDI database are synchronised:
 - CDI number may be missing at central level (at MARIS)
 - CDI number may be missing at local level (in Coupling Table)
 - Format may differs

How checker now works

- Checker in batch mode cross checks central CDI content with local Coupling Table.
- Checker results are stored in CSV file which sums up the data centre's CDI status
- To control your coupling table, open the CSV file with your favorite spreadsheet manager (.e.g MS Excel).

How good records look like ?

DM_Checker_result.csv - LibreOffice Calc
